José Rabadán Jiménez

Fig. 1

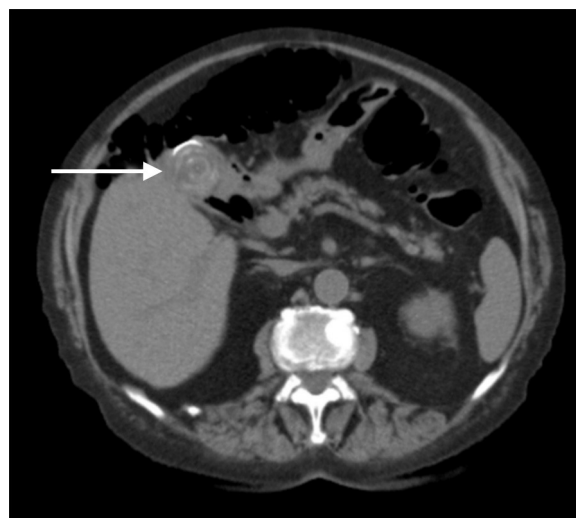

Fig. 2

The patient is an 87-year-old woman with a deteriorating general condition during the previous 4 months with diffuse abdominal pain, melenas, loss of appetite and weight loss.

The work-up showed anemia (7.4 g/dl). Colonoscopy revealed angiodysplasias in the right colon and a 2 cm calculus impacted between 2 folds of the mucous membranes (Fig. 1). Abdominal CT (Fig. 2) demonstrated pneumobilia, cystic mass in the head of the pancreas and a large calculus in the fundus of the gallbladder in contact with the hepatic angle of the colon. The patient refused surgical treatment.

Diagnosis: cholecystocolic fistula.
