Subacute thyroiditis after COVID-19 vaccination

Tiroiditis subaguda tras la vacunación con COVID-19

Dear Editor:

We would like to share ideas on the publication “Subacute thyroiditis after anti-SARS-CoV-2 (Ad5-nCoV) vaccine.¹” Rebollar reported a case and mentioned for possible clinical association between thyroid problem and COVID-19 vaccination.¹ Thyroid problem might be followed vaccination and the pathogenesis is still inconclusive. Regarding subacute thyroiditis, there are sporadic case reports in COVID-19 vaccine recipients.^{2,3} The observed thyroid abnormality might or might not be associated with vaccination. After vaccination, the abnormal thyroid function might occur and it is not related to any immunological abnormality.⁴ Hyperviscosity might occur after vaccination⁴ and it can result in an aberrantly thyroid function.⁵

Reply to "Subacute thyroiditis after COVID-19 vaccination"

Sr. Editor:

La carta de Yasri y Wiwanitkit¹ sobre mi reporte de caso² especula sobre la asociación de vacunación anti COVID-19, hiperviscosidad sanguínea y disfunción tiroidea. No existe una relación fisiopatológica descrita entre hiperviscosidad y «función tiroidea aberrante». Las mediciones hormonales tiroideas espurias ocasionadas por la hiperviscosidad sanguínea y la disfunción tiroidea no deben ser confundidas.

La hiperviscosidad por componentes celulares (proteínas), que pueden ser monoclonales o policlonales, son causa conocida de posible interferencia en los inmunoanálisis usados en tiroides³; entre estas entidades poco comunes se encuentran: macroglobu-
